Despite having the exact same HTML and CSS code, there are subtle differences between my webpage on the browsers Google Chrome, Firefox, and Microsoft Edge. For the index page, the main differences between the three versions are slight variations in the spacing between the elements, mainly the two images. The colors are all the same, and the links behave the same. The contact page however, has much more noticeable differences. The form section of the webpage varies on each one. The Google Chrome version is the one I was testing with, so it looks the most accurate as to what it was intended to be. For the Firefox version of it, rather than the form having just two columns, there is a third column for just the “submit” button; For the Microsoft Edge version, the form box is a bit narrower than it is intended to be, but it has the correct two columns.
